

# 12.1.1 Simulation Summary

The simulation summary (left of Figure 242) provides a quick access to the mean, median and standard deviation of the dRSS, iRSS unwanted and iRSSblocking

The mean is computed using the simulated results in dB. The median is computed using the simulated results converted to linear values and then converted again to dB. The standard deviation (StdDev) is computed using the simulated results in dB. This is further explained in Annex A1.5.1.
