Map Tool

ECO offers an online tool to create graphical maps of CEPT countries.

- Introduction
- Map Files

Introduction

The SVG Map Editor is a browser-based tool for creating annotated, colour-coded maps of countries (or other SVG geometries) for inclusion in reports and documentation. Its core workflow: load an SVG map, click individual regions to assign them a colour and a text label, give each colour a defined meaning that drives an automatic legend, add a title, and export the finished graphic as a PNG or JPG at a chosen pixel size.

Key capabilities.

Area	What it does
SVG ingest	Upload an SVG, or load one automatically from the `files/` folder via `?file=` URL parameter or `settings.json` default
Object colouring & labelling	Click any shape (or its group/class) to set an inline fill colour and per-object label text; groups spanning multiple islands/paths are treated as one unit
Legend	Each colour gets a "meaning" in the right panel; a legend card (swatch + meaning) is rendered on the graphic in a chosen corner, plus a sidebar legend; both appear in exports
Title	Configurable title text, corner placement (4 options), and size (S/M/L), rendered on the map and included in exports
Export	PNG or JPG at specified width/height (up to 16384 px), via canvas rendering with the Inter font embedded
Persistence	Download/upload a versioned JSON settings file mapping element IDs to colours/labels, enabling round-trip reuse and sharing of map configurations
View	Zoom (10–1000%) with fit-to-screen, pan via scrollbars, keyboard shortcuts

Technology.

Pure HTML/CSS/JavaScript with no build step — Tailwind CSS (Play CDN) for styling and SVG.js v3 for live SVG DOM manipulation. Configuration lives in `settings.json` (title, description, default file, help link). Any static HTTP server is sufficient to run it.

Target use case.

Rapid production of specialised country maps with consistent colour legends for internal reports and client documents — replacing manual graphic work in Illustrator/Photoshop with a repeatable, JSON-driven workflow.

Map Files

ECO has 3 different map files, described below:

Map files are basic SVG files, elements are connected based on class name - this assures that all parts (mainland and islands) are connected in the edit tool.

Generic map - no designation (default map)

This map has no country designations. CEPT_Map_Blank.svg

Generic map - ITU country designation

In this map the individual countries are designated by the ITU country code.

CEPT_Map_Symbol.svg

Generic map - full country names

In this map , the individual countries are designated by their full name.
